This clone sequence is one of 5,000 Ceres full-length cDNAs made available to TIGR and Genbank. The following quality assessment of this set was done by comparison with known proteins: two percent of the clones are estimated to be 5'-truncated; less than one percent are 3'-truncated; approximately two percent represent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the translation initiation start (ATG). A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 (bases 1 to 1652)

Please note that these cDNA sequences are derived from the Ws or LAer ecotypes and therefore may contain polymorphisms when compared to sequences from Col-0. Genset carried out the library production and sequencing of the full-length clones. Ceres, Inc. carried out the clustering of the 5' sequences, selection of clones, and sequence assembly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polymucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2000-412336/35

                                                                                                                                                                                                                                                                                                                            The present sequence is a cDNA encoding sphingolipid desaturase from clone wrel.pk0004.c7:fis isolated from wheat etiolated seedling root cDNA library, wrel. The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polynucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                 Sequence 1972 BP; 382 A; 616 C; 490 G; 484 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2000-412336/35.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes an isolated nucleic acid encoding an evening primrose Delta6-desaturase. The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producing low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This sequence encodes the evening primrose delta6 desaturase involved in the production of gamma linoleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1702 BP; 358 A; 471 C; 446 G; 427 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid encoding an evening primrose CC delta-6-desaturase polypeptide. The nucleic acid, a vector comprising the CC nucleic acid or a nucleic acid encoding delta-12-desaturase, is useful CC for producing a plant (such as sunflower, soybean, maize, tobacco, CC peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or CC vector and regenerating a plant with increased GLA content from the plant CC ell, for inducing or increasing production of GLA in an organism lacking CC ortadecatetraenoic acid in at least one of a plant deficient or lacking CC octadecatetraenoic acid in at least one of a plant deficient or lacking CC in or producing low levels of octadecatetraenoic acid, a bacterium which CC produces alpha-linolenic acid or a bacterium which exhibits a CC delta-15-desaturase activity on a GLA substrate. This sequence represents CC cDNA encoding an evening primrose delta-6-desaturase polypeptide.

The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase whi in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polynucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -
